

Permits/Treatment Plan

Each state has its own regulatory requirements regarding the application of herbicides to waterways. Before applying herbicides, LRS reviews all applicable state, federal, and label requirements, applying for permits when necessary.

LRS can obtain and hold the permit for specific projects.

Prior to performing any aquatic herbicide treatment, a treatment plan is outlined in coordination with the project manager including the posting/notification program, treatment methodology, monitoring techniques to be used, herbicide delivery and storage protocols, treatment schedule, and format required for all final reports.

Herbicide treatments are an effective method for control of aquatic invasive plants. Our application systems have been used effectively for Eurasian Watermilfoil control in Idaho and Washington since 1999 and are continuously undergoing improvements as new technology, techniques, and ideas based on project experience become available.
